

Obtain Data Validation

We offer an intelligent validation solution that gives you full visibility and direct access to error handling, without heavy setup or complex customization.

Intelligent validation solution that validates all data areas in your ERP system

Our Data Validation ensures that all parameters, system setup, user behavior, incorrect usage, incomplete data and deactivated validation rules and customer-specific adjustments are checked so that Best Practice is always adhered to.

Support has never been easier

Once the validation tool is set up and has run the process, you are presented with a complete status report where all error messages are grouped by their critical status. From here you can click on the error and go directly to it, which is also marked within the ERP system. You can either fix the error yourself, or you can forward it, for example, via DevOps, which will create a task, including an error message description.

Solid foundation for operations, development and auditing

- Validation of all data areas in your solution.
- Overall overview of errors and how critical they are.
- Direct link to the error, as well as a description.
- Create support case with a single click via Azure DevOps integration.
- Template for future creations in the ERP system, so you avoid the same mistakes.

Validates all data areas, such as standard modules, third-party ISV solutions, and custom fields and tables.

Faster support and task management with AI, machine learning and best practices.

Get notified via SMS about critical errors in the ERP system.
